

ABSTRACT

A waterproof contact comprising a base plate, a side-wall extending from the base plate in a substantially vertical direction so as to form a housing, said housing having an opening
5 essentially opposite to the base plate. A first and a second outer terminal penetrate the base plate so as to form a first and a second contact area on an inner surface of the base plate. A movable knob is adapted to be moved in a direction substantially perpendicular to a plane defined by the inner surface of the base plate, said knob comprising a bottom part positioned in the housing, a top part positioned outside the housing, and a middle part
10 connecting said bottom and top part and being positioned in the opening of the housing. An electrical conductor is attached to said bottom part for providing electrical contact between said terminals, and the contact comprises sealing means for providing a waterproof seal between said housing and said movable knob.
